Structural steel protection

Numerous research programmes show that some types of fully stressed steel sections can achieve a 30 minute fire resistance without any additional protection materials being applied. However, these apply to a limited number of steel sections only, based on the allowable Section Factor H_p/A . Section Factor is a common term used in fire protection for steelwork and is discussed in detail below.

Typical building regulations usually require certain elements of structure to be fire resistant for more than 30 minutes and up to a specified minimum period of time. The thickness of any fire protection material depends on a number of factors, such as:

- Duration of fire resistance specified
- Type of protection used, e.g. board, paint, spray etc
- Perimeter of the part of steel section exposed to fire
- Shape and dimensions of the steel section

To determine how these various factors affect the fire resistance, all Promat products and systems have been tested at nationally accredited laboratories around the world to a variety of standards, e.g. BS 476: Part 21, ASTM E119 and BS EN 13381.

Tests carried out in accordance with the above standards are performed on both loaded and unloaded beams and columns which are clad with fire protection material. Steel surface temperatures are monitored with thermocouples to assess the performance of the cladding. Steel that is fully stressed in accordance with the design guides BS 449 or BS 5950: Part 1, begin to lose their design margin of safety at temperatures around 550°C.

The table below shows how the strength of steel reduces as temperatures rise, i.e. variation of effective yield strength factor of normal structural steels with temperature.

Temperature (°C)	20	100	200	300	400	500	600	700	800
Effective yield strength factor	1.00	1.00	1.00	1.00	1.00	0.78	0.47	0.23	0.11

For example, at 700°C, the effective yield strength of Grade 43 (S275) steel is $0.23 \times 275 = 63.25\text{N/mm}^2$.

A range of unloaded sections are also tested to obtain data for analytical calculation, to measure exactly how much protection is needed for the most common steel sections and for providing fire resistance for different time periods.

IMPORTANT: When using Promat protection systems for structural steelwork, conservative limiting temperatures of 550°C and 620°C are referred to for columns and beams respectively and are in general use throughout this brochure. Apart from temperature data, the fire tests also need to demonstrate the ability of cladding to remain in place, usually described as the "stickability" of the material, for the maximum duration for which the protection may be required. The availability of thin materials and the low weight of Promat systems, plus the possibility of prefabrication, ensure maximum cost efficiency.

Section factor (Hp/A)

The degree of fire protection provided depends on the Hp/A Section Factor for the steel section. The Hp/A factor is a function of the area of the steel exposed to the fire and the mass of the steel section. The higher the Hp/A, the faster the steel section heats up and so the greater the thickness of fire protection material required.

It should be noted that in European design standards, the section factor is presented as A/V which has the same numerical value as Hp/A. A/V measures the rate of temperature increase of a steel cross section by the ratio of the heated surface area to the volume. It is likely to gradually replace the use of Hp/A.

Depending on type of material used for protection, the calculation method for Hp/A value may differ. Generally there are two methods of construction for the protection materials: box protection and profile protection.

Box protection using board materials

For box protection, Hp is the sum of the inside dimensions of the smallest possible rectangular or square encasement of the steel section. One exception is circular hollow sections.

Where a steel section abuts or is built into a fire resisting wall or floor, the surface in contact with or the surface within the wall or floor is ignored when calculating Hp. See page 7.

However, the value A is always the total cross sectional area of the whole steel section.

Profile protection using spray/ paint materials

Encasements following the profile of the steel section will generally have a higher Hp/A section factor than a box encasement. One exception is circular hollow sections. See page 8.

The serial size and mass per metre of most steel sections are available in tables from steel manufacturers. Sometimes such tables also provide Hp/A values calculated for three or four sided box protection.

Following is an example of a calculation for a steel beam section of 406mm x 178mm x 54kg/m serial size to be encased on 3 sides using box protection method:

$$\text{Serial size} = 406\text{mm} \times 178\text{mm}$$

$$\text{Actual size} = 402.6\text{mm} \times 177.6\text{mm}$$

$$\begin{aligned}\text{Hp} &= B + 2D \\ &= 177.6 + 2 \times 402.6 \\ &= 982.8\text{mm (0.9828m)}$$

$$A = 68.4\text{cm}^2 (0.00684\text{m}^2)$$

$$\begin{aligned}\text{Hp/A} &= 0.9828 \div 0.00684 \\ &= 144.7\text{m}^{-1} \\ &\approx 144\text{m}^{-1}\end{aligned}$$

The value of A, the cross sectional area, can be obtained either from steelwork tables or by accurate measurement. However, if the mass per metre is known then the Hp/A value can be calculated as follows:

$$\begin{aligned}\frac{\text{Hp}}{\text{A}} &= \frac{7850 \times \text{Hp}}{\text{W}} \\ \text{Where W} &= \text{Mass of per metre (kg/m)} \\ \text{Where 7850} &= \text{Nominal density of steel}\end{aligned}$$

Sample calculation using the previous example:

$$\begin{aligned}\frac{\text{Hp}}{\text{A}} &= \frac{7850 \times 0.9828}{54} \\ &= 142.87\text{m}^{-1} \\ &\approx 143\text{m}^{-1}\end{aligned}$$

The shape of the steel section can also play an important role when determining the required thickness of a protection material. Following are some notes for reference. For details on steel profiles not outlined here, please consult Promat.

Castellated sections /cellform beams

These steel members heat up more quickly than the original section from which they were produced. Common practice is that protection thickness should therefore be 20% greater than those calculated from the Hp/A value of the original section from which the castellated section is formed.

However, it should be noted that the above information is now superseded by a new, more scientific approach for the protection of castellated sections. The following is taken from "Fire Protection for Structural Steel in Buildings", 4th Edition, published by the ASFP (see www.asfp.org.uk).

The recently amended method of obtaining the section factor (Hp/A) for castellated sections is now specific. In fact, the recommendation from the Steel Construction Institute, published as RT 1085, for castellated sections and cellular beams manufactured from all rolled steel sections and from welded plate, the Section Factor for passive protection system is calculated as:

$$\text{Section factor (m}^{-1}\text{)} = 1400/t$$

$$\text{Where } t = \text{the thickness (mm) of the lower steel web and applies for beams made from all steel rolled sections and from welded steel plate.}$$

It should be noted that there are a number of conditions attached to the use of this calculation method, which are detailed in the ASFP "Yellow Book" publication.

Individual protection products, normally quite similar in performance when compared on the basis of rolled steel sections, may require radically different thickness for the same cellular beam.

Structural hollow section

The same thickness of board materials can be used on square, rectangular and circular hollow sections as on 'I' sections of the same Hp/A value.

Bracing

Bracing is included in a structure to give resistance to wind forces and provide overall stiffness. Masonry walls and steel cladding contribute to a structure's rigidity but these are rarely taken into account in design. Also, the probability of a major fire occurrence concurrent with maximum wind load is remote (see BS 5950: Part 8). It seems unreasonable therefore to apply the 550°C steel temperature criteria to bracing. While each case must be judged on individual merits, protection to bracing is generally not necessary, but where it is required the Hp/A value of the bracing section or 200m⁻¹ should be used, whichever is the lesser.

Lattice members

As the determination of the protection necessary to protect lattice members requires broad consideration of the lattice design, please consult Promat concerning such steel sections.

Partially exposed members

Where columns or beams are partly built into or are in close contact with walls or floors, the protection afforded to the steelwork by the wall or floor should be taken into account. In those instances where the steel section sits within or against masonry or concrete constructions, this will give protection to the adjacent surface of the steelwork. Thus, for the purpose of determining the heated perimeter (Hp), this should be taken as only that part of the steel section which is exposed. It should be noted that where the steelwork penetrates both sides of a fire resisting construction, e.g. a wall protruding into a space which has an open end, simultaneous attack from fire on both sides may occur on columns partially exposed within the wall. In such an instance, the section factor should be calculated based upon the sum of the areas exposed to fire on either side of the wall and the total volume of the steel section.

Note that separating elements are generally required to offer a performance including the insulation criteria of 140°C or 180°C. Therefore, where a steel section passes through a separating element and is exposed on both sides, consideration must also be given to providing sufficient protection not only to maintain the temperature of the steel section below 550°C but also to ensure the surface temperature on the unexposed face does not exceed the 140°C or 180°C insulation criteria of the separating element. Due allowance for any expected building movement should also be considered.

External lightweight walls

Where the structural elements form portal legs supporting a lightweight external wall, the insulation performance required of the wall may contribute to the protection of any column flange falling within the thickness of the wall. In such cases, please consult Promat to confirm the board thickness and which areas of such columns should be protected.

Internal lightweight partitions/walls

Where a column or beam is built into a fire resistant lightweight wall or partition, the protection to the steelwork can generally be designed on the assumption that only one side of the wall or partition will be exposed to fire at any one time. The wall or partition should be adequately secured to the column in such a way as to ensure the wall or partition will not apply stress on the protection encasement. Due allowance for any expected building movement should be considered.

Floors

Where beams are wholly within the cavity of a timber floor protected by a PROMATECT®-H ceiling, test evidence shows that the cavity air temperature of the floor is such that the beam will be adequately protected to the same fire resistance by the ceiling that protects the floor. Where the beam is wholly or partly below the line of the PROMATECT®-H ceiling then Hp should be based upon the portion of the steel beam that is below ceiling level.

Beams supporting composite floors with profiled metal decking

A series of fire resistance tests has demonstrated that it is not always necessary to fill the void formed between the top flange of a beam and the underside of a profiled steel deck. Recommendations based on the research have been published by the Steel Construction Institute (UK) and for decks running perpendicular to the beams, are as follows:

Dovetail decks

Voids may be left unfilled for all fire resistance period, unless a fire resisting wall or partition is located beneath the beam.

Trapezoidal decks

Generally, voids may be left unfilled for up to 60 minutes fire resistance. Also, for 90 minutes if the board thickness used is appropriate for the Hp/A + 15%. Care should be taken to ensure that if the voids are unfilled, the main encasement will need to be adequately secured. For periods over 90 minutes the voids should be filled.

In all instances, voids should also be filled if a fire wall is located beneath the beam, for all fire resistance periods. These recommendations apply to board encasements. The trapezoidal steel deck slab should be designed to act structurally with the beam. If this is not the case, the voids should be filled for all fire resistance periods.

Various box protection

Protection configurations with values of perimeter H_p for use in the calculation of section factor H_p/A (A/V)

Steel section	Profile protection				
Universal beams, columns and joists (plain and castellated) 	Four sides  $2B + 2D$	Three sides  $B + 2D$	Three sides (partially exposed)  $B + 2d$	Two sides  $B + D$	One side (partially exposed)  B
Structural and rolled tees 	Four sides  $2B + 2D$	Three sides (flange to soffit)  $B + 2D$	Three sides (toe of web to soffit)  $B + 2D$		
Angles 	Four sides  $2B + 2D$	Three sides (flange to soffit)  $B + 2D$	Three sides (toe of flange soffit)  $B + 2D$		
Channels 	Four sides  $2B + 2D$	Three sides (web to soffit)  $2B + D$	Three sides (flange to soffit)  $B + 2D$		
Square or rectangular hollow sections 	Four sides  $2B + 2D$	Three sides  $B + 2D$			
Circular hollow sections 	Four sides  $2B + 2D$		NOTE: The air space created in boxing a circular section improves the insulation and the value of H_p/A . Therefore, H_p higher than profile protection (p) would be anomalous. Hence, H_p is taken as the circumference of the circular section and not $4D$.		

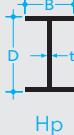

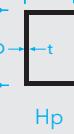

Following is an example of calculation for a universal beam section using profile protection of 305mm x 305mm x 240kg/m serial size to be encased on three or four sides when $A = 305.6\text{cm}^2$, $B = 317.9\text{mm}$, $D = 352.6\text{mm}$, $t = 23\text{mm}$.

Four sided profile protection:	Three sided profile protection:
$H_p = 2B + 2D$ $= (2 \times 317.9) + (2 \times 352.6)$ $= 1341\text{mm (1.341m)}$	$H_p = B + 2D$ $= 317.9 + (2 \times 352.6)$ $= 1023.1\text{mm (1.023m)}$
$H_p/A = 1.341 \div 0.03056$ $= 43.9\text{m}^{-1}$	$H_p/A = 1.023 \div 0.03056$ $= 33.5\text{m}^{-1}$

The above calculated values are approximate in that radii at corners and roots of all sections are ignored. In these figures, $H_p/A = A/V$.

Various profile protection

Protection configurations with values of perimeter Hp for use in the calculation of section factor Hp/A (A/V)

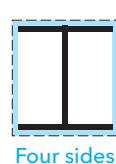

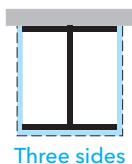

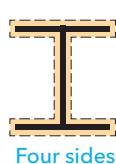

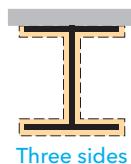

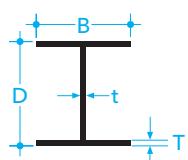

Steel section	Profile protection				
Universal beams, columns and joists (plain and castellated) 	Four sides  $2B + 2D + 2(B - t) = 4B + 2D - 2t$	Three sides  $B + 2D + 2(B - t) = 3B + 2D - 2t$	Three sides (partially exposed)  $B + 2d + (B - t) = 2B + 2d - t$	Two sides  $B + D + 2(B - t)/2 = 2B + D - t$	One side (partially exposed)  B
Structural and rolled tees 	Four sides  $2B + 2D$	Three sides (flange to soffit)  $B + 2D$	Three sides (toe of web to soffit)  $B + 2D + (B - t) = 2B + 2D - t$		
Angles 	Four sides  $2B + 2D$	Three sides (flange to soffit)  $B + 2D$	Three sides (toe of flange soffit)  $B + 2D + (B - t) = 2B + 2D - t$		
Channels 	Four sides  $2B + 2D + 2(B - t) = 4B + 2D - 2t$	Three sides (web to soffit)  $2B + D + 2(B - t) = 4B + D - 2t$	Three sides (flange to soffit)  $B + 2D + 2(B - t) = 3B + 2D - 2t$		
Square or rectangular hollow sections 	Four sides  $2B + 2D$	Three sides  $B + 2D$			
Circular hollow sections 	Four sides  πD				

Following is an example of calculation for a universal beam section using profile protection of 305mm x 305mm x 240kg/m serial size to be encased on three or four sides when A = 305.6cm², B = 317.9mm, D = 352.6mm, t = 23mm.

Four sided profile protection:	Three sided profile protection:
$Hp = 4B + 2D - 2t$ $= (4 \times 317.9) + (2 \times 352.6) - (2 \times 23)$ $= 1930.8\text{mm (1.931m)}$	$Hp = 3B + 2D - 2t$ $= (3 \times 317.9) + (2 \times 352.6) - (2 \times 23)$ $= 1612.9\text{mm (1.613m)}$
$Hp/A = 1.931 \div 0.03056$ $= 63.1\text{m}^{-1}$	$Hp/A = 1.613 \div 0.03056$ $= 52.8\text{m}^{-1}$

The above calculated values are approximate in that radii at corners and roots of all sections are ignored. In these figures, Hp/A = A/V.

PROMATECT®-H structural steel fire protection Hp/A ratio

Hp/A ratio table 1 - Lambda method

Up to 240/- fire resistance in accordance with the requirements of BS 476: Part 21: 1987 (reports no. 2014-Efectis-R00636 Rev.1 and R22F24-1A issue 1) for structural steel column and beam protection at critical temperature of 550°C.

350	25	24		42	
360	25	24		42	

The thickness in above tables can be made up from a single layer or no more than two layers of PROMATECT®-H board.

For two layer application, secure the thinner layer first and stagger all joints between layers at minimum 300mm centres.

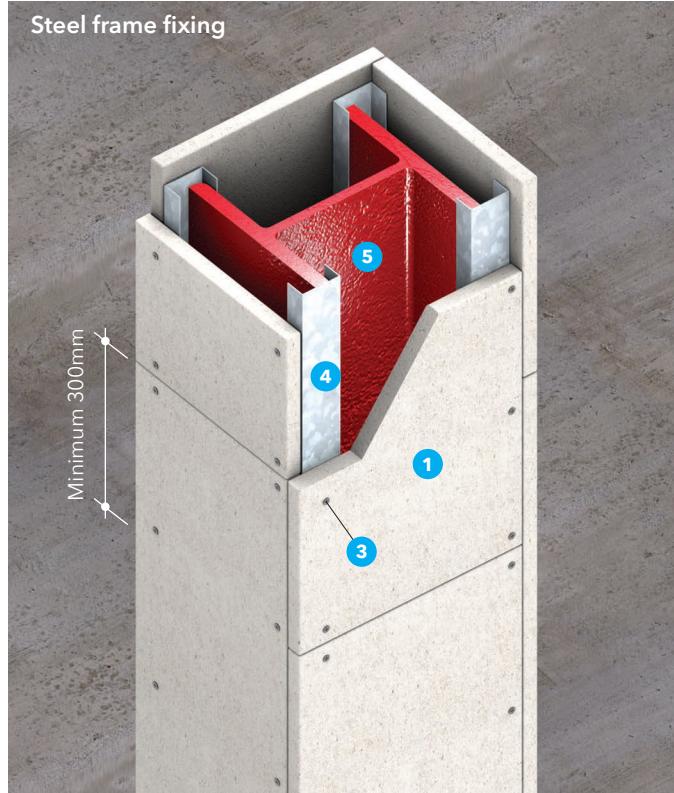

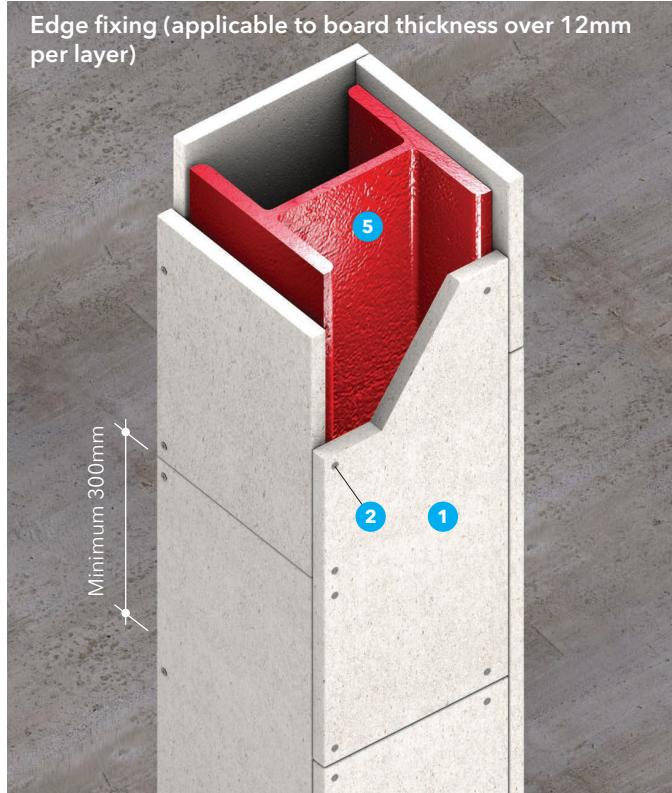

For four sided encasement of column, install the second layer separately from the first layer and no gap is required between layers.

For encasements of beam, screw the second layer to the first layer.

In a single project, we highly recommend user choose either Lambda or Numerical Regression method to determine the thickness. We decline any options chosen both method in a single project, or please consult Promat for further details.

PROMATECT®-H – 1, 2 & 4-hour fire rated structural steel column cladding

FRR	Model number	Standard
60/-/-	PH.01.60	BS 476: Part 21: 1987
120/-/-	PH.01.12	BS 476: Part 21: 1987
240/-/-	PH.01.24	BS 476: Part 21: 1987

1. PROMATECT®-H board, thickness in accordance with the Hp/A ratio tables on page 28.
2. M4 self tapping screws at 200mm centres or steel staple as per table below.
3. M4 self tapping screws at nominal 200mm centres.
4. Steel channel min. 40 x 40 x 1.6mm thick.
5. Structural steel column.

Fixing table: Single layer

Board thickness	Staple			c. t. c. distance (mm)
	length (mm)	width (mm)	thickness (mm)	
12mm	25	5.85	1.27 x 1.05	100
15mm	35	10.5	1.45 x 1.30	100
20mm	50	10.5	1.45 x 1.30	100
25mm	50	10.5	1.45 x 1.30	100

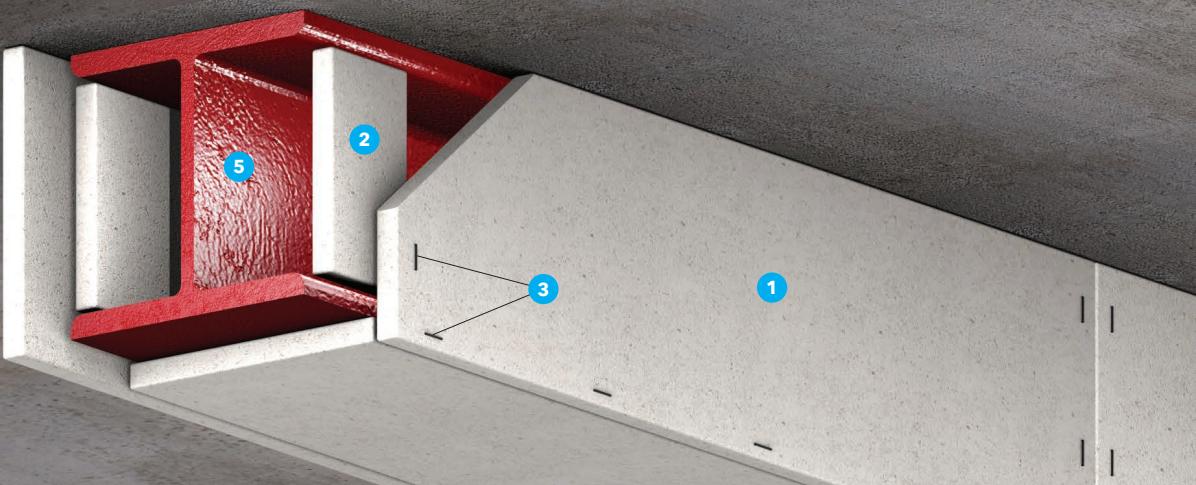

Fixing table: Double layer

2 x 20mm	50	10.5	1.45 x 1.30	40	10.5	1.45 x 1.30	100
2 x 25mm	50	10.5	1.45 x 1.30	50	10.5	1.45 x 1.30	100

PROMATECT®-H board when connected to Brickwork/Gypsum/Masonry Concrete walls up to 240 minutes loadbearing capacity to BS476: part 21 and integrity and insulation to BS 476: part 22 (2014EffectisR000636Rev.1 and R21M21-1A issue 1)

1. Minimum PROMATECT®-H board thickness on each side of the beams or columns as table below.

Fire resistance	PROMATECT®-H board thickness
60 minutes	18mm (2 x 9mm)
120 minutes	25mm (2 x 12mm)
240 minutes	40mm (2 x 20mm)

2. Steel angles, minimum 0.9mm thick fixed to steelwork.
3. M4 screws or shot-fired fixings at 300mm centres.
4. M4 self-tapping screws at 200mm centres; screw length to provide 10mm penetration through angle.
5. M4 screws at 200mm centres into metal plugs; screw length to provide minimum 30mm penetration into plug. Fixings to be minimum 50mm from edge of concrete wall.

6. M4 steel self-tapping screws or shot-fired nails. All fixings at 200 mm nominal centres and must be of such a length that they penetrate at least 10 mm beyond the interface of the board and steel flange. The screws and nails may be fitted with or without steel washers. Two vertical rows of fixings are used, each row between 25 mm and 85 mm from the adjacent vertical edge of the board.

7. Structural steel column.
8. Concrete wall substrate.
9. Caulk all edges between the board and the wall with PROMASEAL® Intumescent Acrylic Sealant, depth in accordance with the required board thickness.

PROMATECT®-L structural steel fire protection Hp/A ratio

Hp/A ratio table

Up to 240/-/- fire resistance in accordance with the requirements of BS 476: Part 21: 1987 (report no. 2015 Efectis R000320 Rev.2 and R22L15-1A issue 1) for structural steel column and beam protection at critical temperature of 550°C

Fire resistance	PROMATECT®-L thickness combination						
	20	25	30	40	45	50	55
30 minutes	359						
60 minutes	320	359					
90 minutes	140	210	310	359			
120 minutes	90	120	160	300	359		
180 minutes	50	60	80	120	150	180	
240 minutes	–	45	50	70	80	100	110

The thickness in above tables can be made up from a single layer or no more than two layers of PROMATECT®-L board.

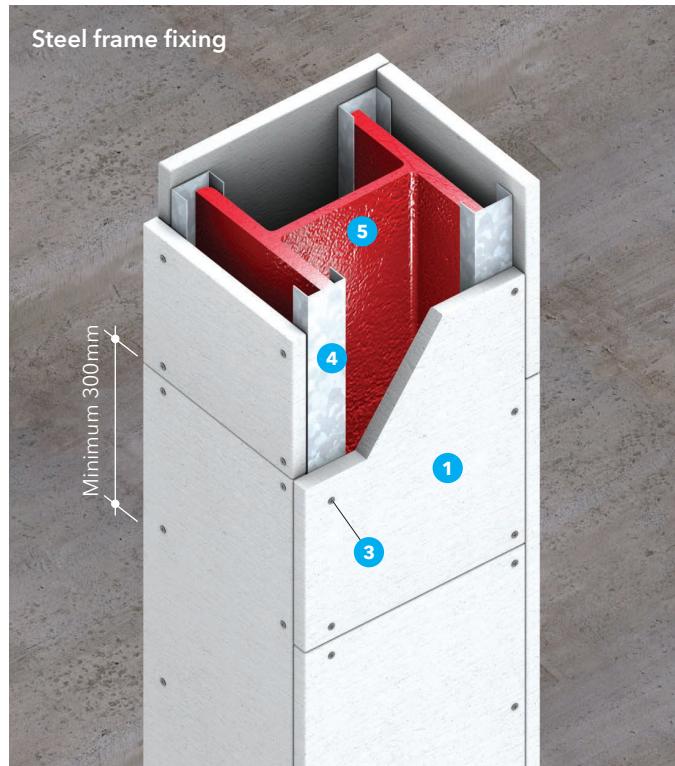

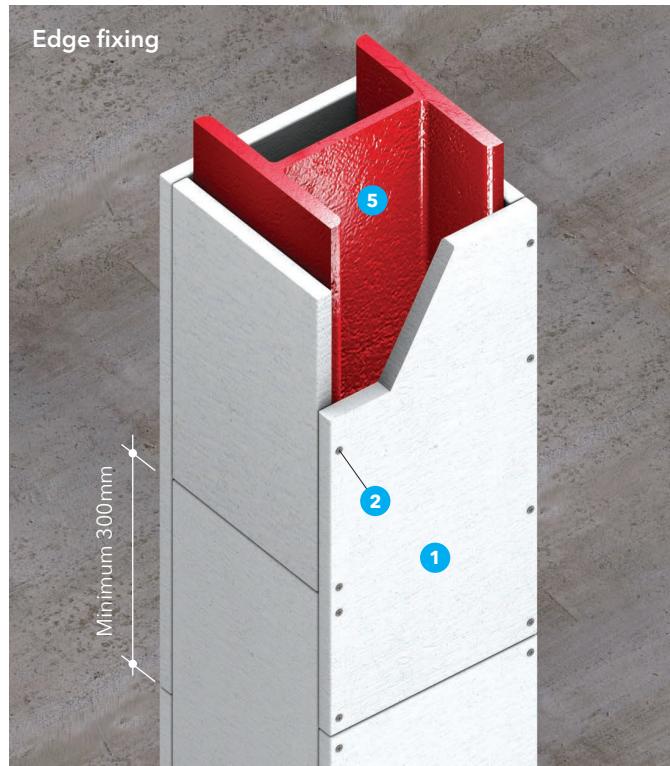

For two layer application, secure the thinner layer first and stagger all joints between layers at minimum 300mm centres.

For four sided encasement of column, install the second layer separately from the first layer and no gap is required between layers.

For encasements of beam, screw the second layer to the first layer.

PROMATECT®-L – 1, 2 & 4-hour fire rated structural steel column cladding

FRR	Model number	Standard

About Etex

Etex is a global building material manufacturer and pioneer in lightweight construction. Etex wants to inspire people around the world to build living spaces that are ever more safe, sustainable, smart and beautiful.

Founded in 1905, headquartered in Zaventem, Belgium, Etex is a family-owned company with more than 13,500 employees globally. It operates more than 140 sites in 45 countries and recorded a revenue of EUR 3.0 billion and a REBITDA of EUR 570 million in 2021. Etex fosters a collaborative and caring culture, a pioneering spirit and a passion to always do better for its customers.

Etex has five R&D centres supporting five global divisions:

- Building Performance: dry construction solutions including plasterboards and fibre cement boards, plasters and formulated products, passive fire protection and associated products.
- Exteriors: a range of aesthetic fibre cement materials for use in agriculture, architectural and residential exteriors.
- Industry: fire protection and high-performance insulation products for the construction and OEM (Original Equipment Manufacturer) industries.
- Insulation: glass mineral wool and extruded polystyrene (XPS) for thermal and acoustic insulation.
- New Ways: high-tech offsite modular solutions based on wood and steel framing.

Etex's global portfolio includes leading commercial brands such as Promat, Kalsi, Siniat, Equitone, Eternit, Cedral, Durlock, Gyplac, Pladur, Superboard and URSA.

Etex is Inspiring Ways of Living, for more information, please visit our website: www.etexgroup.com
